# Intro to Longhorn

Open Source Cloud-Native Distributed Block Storage Built On and For K8s

*Sheng Yang, Rancher Labs*

**CLOUD NATIVE  
COMPUTING FOUNDATION**

# LONGHORN

Open Source  
Distributed Block Storage Software  
For Kubernetes  
<https://longhorn.io/>

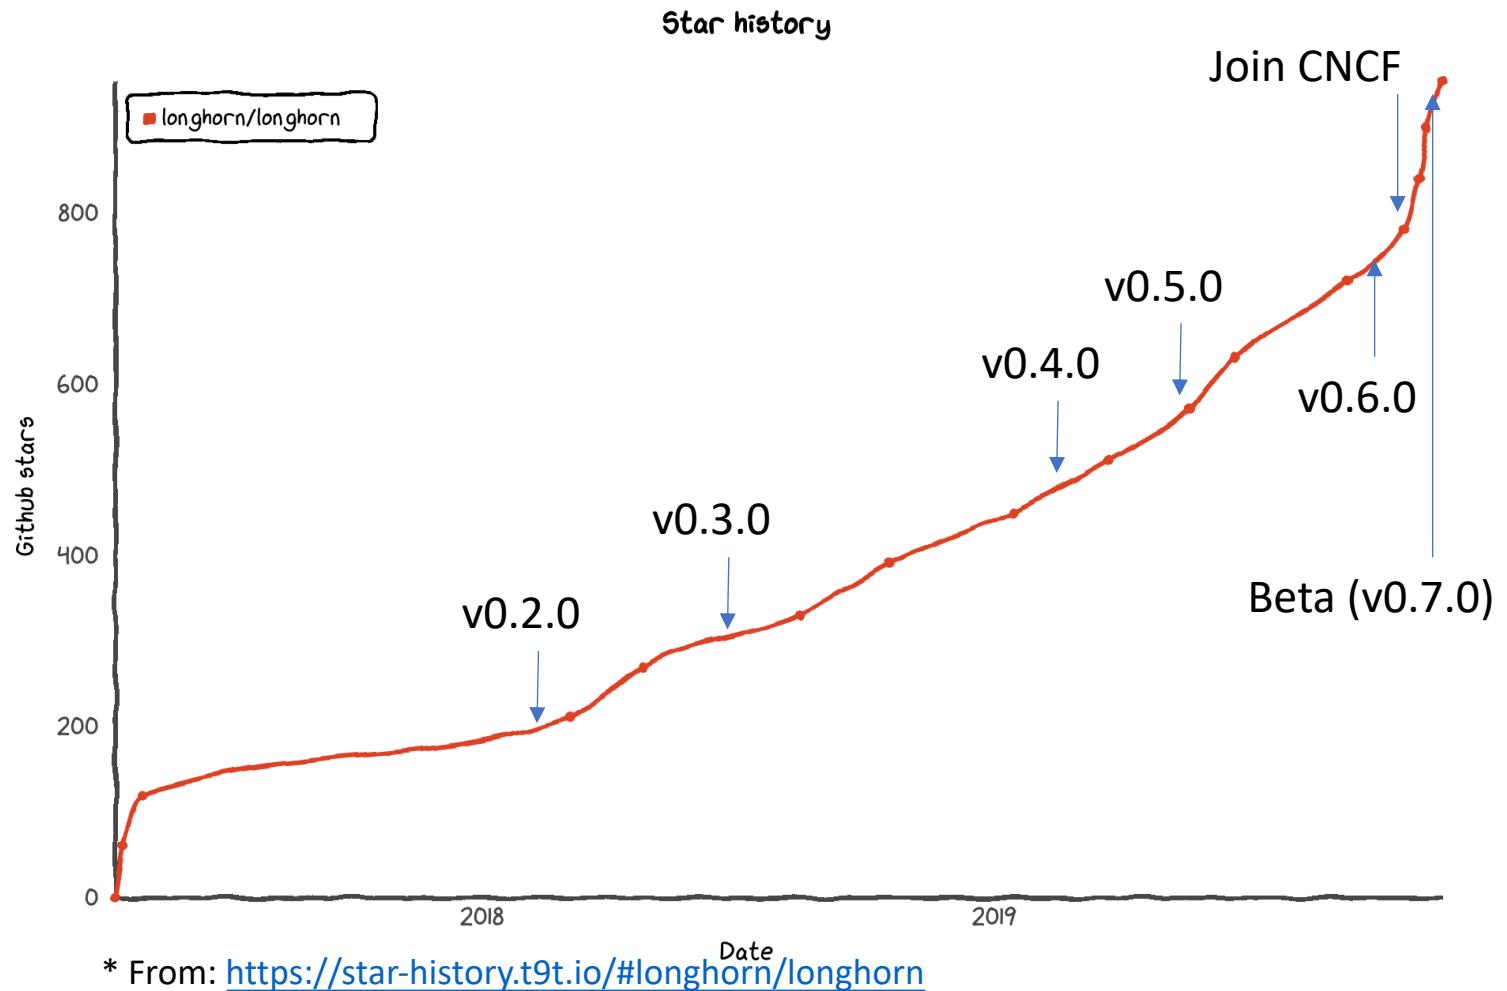

One click to add persistent storage support to any Kubernetes cluster

# Compare Longhorn to legacy storage software

Legacy Storage Software	Longhorn
Implements sophisticated storage stack that includes disk management, storage virtualization, file systems and storage protocols	Leverages modern high-speed, high-capacity SSD/NVMe and proven Linux storage features
HA storage controllers that handle very high IOPS and throughput across the cluster, could become a bottleneck	Each volume is a set of independent microservices, orchestrated by Kubernetes
Hundreds of thousands lines of code, it's complex	40k lines of Golang code, broken into clean modules

# History

- First started in September 2014
- First iteration (2014 – 2016) close source, written in C++
- Second iteration (2016 – 2018) open source, written in Go, build for Docker
- Third iteration (2018 – now) open source, written in Go, build on and for Kubernetes
- 12 formal releases since 2018
- 900+ stars in GitHub now

# Latest release: Longhorn v0.7.0 (Beta)

- Enterprise-grade distributed block storage software for Kubernetes
- Volume snapshots
- Volume backup and restore
- Storage Tag for node and disk selection
- Cross-cluster disaster recovery volume with defined RTO and RPO
- Live upgrade of Longhorn software without impacting running volumes
- Intuitive UI
- One click installation
- And more!

# Live Demo

# Longhorn Architecture - Engine

# Longhorn Architecture - Manager

# Community

- [900+ GitHub Stars](#)
- Monthly community meeting at 9 am Pacific Time on the second Friday morning
  - See <https://github.com/longhorn/community>
- 300+ Users in the Slack channels
  - #CNCF/longhorn <https://slack.cncf.io/>
  - Migrating from #RancherUsers/longhorn-storage
- Contributions are welcome!

# Target in 2020

- Reach 1.0 GA
  - Includes features like volume resizing, performance metrics, QoS, et cetera
- Increase community by 10x
  - Includes both user community and developer's community
- Reach incubator level in CNCF
